

---

What is the the calculator? calc.exe is an old calculator program. It has basic functionality, so it's not very good for programming. But, it can display scientific notation and handle integers really well. It would be best for you to use it if you don't know what else to use or if this is your first time using a computer typewriter.

What are some other calculators that I should try? If you're looking for something better than calc which has better accuracy and other features, try out the Microsoft Equation Editor or Calc (opens in Windows). If you want something easy, try out MathType which is a software typeface that works with the Equation Editor.

If I want to use this program, can I put it on my computer? Yes. You can download calc.exe to your computer and then run it like any other application (Windows shortcut, Linux command). To be able to print it out, however, you'll need another program called pdflatex. If you don't know what pdflatex is, check out the previous question about printers.

How do I install this program? The download comes with an installation file. If you're using Windows, you can simply double click the installation file and follow the prompts to install calc.exe. If you're using Linux, you'll need to run the script with your shell.

Why doesn't my computer have Braille support? If your computer is running Windows 2000, XP, Vista, or 7; it has braille support. Check "Control Panel" > "Universal Access" > "Braille..." and make sure that "Braille output" is selected under the display tab and that a device is chosen in the output field below it. If none of these options are available, you'll need to install the drivers from the Microsoft website. If your computer is running Windows ME or 98, it doesn't have braille support. If your computer is running a newer operating system, chances are it has braille support built in.

How do I print this document in a printer? This document came with a .pdf file which can be printed by converting it into a Postscript file using pdflatex . Windows users can use Microsoft Word, which will also convert the .pdf to Postscript. If you're using Linux or Mac OS X, you'll need to use a software program called pdflatex if you don't have Postscript support. There are other programs that can print in formats other than PDF and Postscript. If you're using a non-Microsoft operating system and would like to try one of these programs to convert your file into a format that we can print, we may help.
